4089. Count Subarrays With Loose Bounds

Solved

Medium

You are given an integer array `nums` and two integers `minK` and `maxK`.

A **loose-bound subarray** is a **subarray** in which every element is **greater than or equal to** `minK` and **less than or equal to** `maxK`.

Return the **number** of loose-bound subarrays in `nums`.

A **subarray** is a contiguous **non-empty** sequence of elements within an array.

Example 1:

> **Input:** nums = [1,4,7,3], minK = 1, maxK = 5
>
> **Output:** 4
>
> **Explanation:**
>
> The loose-bound subarrays are `[1]`, `[4]`, `[3]`, and `[1, 4]`. The minimum value in these subarrays is at least `minK = 1` and the maximum value is at most `maxK = 5`.

Example 2:

> **Input:** nums = [1,1], minK = 1, maxK = 1
>
> **Output:** 3
>
> **Explanation:**
>
> The loose-bound subarrays are `[1]`, `[1]`, and `[1, 1]`. The minimum value in these subarrays is at least `minK = 1` and the maximum value is at most `maxK = 1`.

Constraints:

- `2 <= nums.length <= 10^5`
- `1 <= nums[i], minK, maxK <= 10^6`
